TECHNICAL SKILLS

Languages: Python, Java
Automation

Operating Systems: Linux, Windows, MacOS

Other: Problem Solving, AI

PROJECTS

Password Strength Analyzer & Generator

Python

- Developed a modular password analysis tool evaluating strength across length, character diversity, and complexity rules, enabling users to pinpoint specific weaknesses and immediately improve their password security
- Implemented validation logic enforcing uppercase, lowercase, numeric, and special character requirements, producing targeted per-rule feedback that guides users toward selecting stronger, policy-compliant passwords
- Designed a configurable password generator that auto-produces secure, rule-compliant passwords on demand, eliminating manual guesswork and ensuring consistent adherence to security standards

Phishing URL Detector

Python

- Built a phishing detection engine using pattern recognition and heuristic-based rules to classify URLs as safe or malicious, reducing the risk of users inadvertently interacting with harmful links
- Extracted and analyzed key features including suspicious keywords, URL length, and domain structure, improving classification accuracy across a range of real-world phishing attack patterns
- Automated the full URL inspection pipeline in Python, eliminating manual link-review effort and enabling scalable threat identification across large volumes of input

Caesar Cipher Tool

Java

- Implemented a Caesar Cipher encryption and decryption engine in Java with dynamic user-defined shift values, enabling reliable encoding and accurate recovery of original plaintext messages
- Designed modular, reusable encoding functions with full non-alphabetic character preservation, ensuring clean output while demonstrating core cryptographic algorithm design principles

Network Monitor

Python

- Developed a real-time network monitoring tool in Python to track connection activity and traffic patterns, increasing system-level visibility and enabling early detection of irregular behavior
- Implemented a structured logging system that captures and flags anomalous network activity, enabling rapid identification of patterns consistent with potential security threats

EDUCATION

Toronto Metropolitan University

Bachelor of Science, Computer Science

Toronto, ON

Expected Graduation 2030

VOLUNTEER EXPERIENCE

South Asian Women's Rights Organization

Computer Literacy Volunteer

Toronto, ON

Oct 2023 – Dec 2024

- Instructed community members with limited technical backgrounds in foundational computer skills, enabling independent navigation of digital tools and services
- Guided participants through file management and essential software applications across recurring weekly sessions, reducing reliance on external technical support
- Adapted instructional methods to diverse learning styles, ensuring consistent skill comprehension and retention among all participants
